

More Examples of Major or "Take" Reactions to Smallpox Vaccination

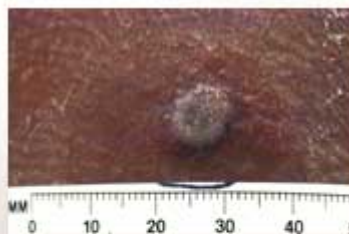

Formation by days 6-8 post-vaccination of a papule, vesicle, ulcer, or crusted central lesion, surrounded by an area of induration signifies a response to vaccination; this event is referred to as a major reaction or a "take," and usually results in a scar.

Normal reactions include a wide spectrum of cutaneous presentations:

Normal Reaction

Normal Reaction

Normal with Lymphangitis

Normal with Satellite Lesions
